

# Command pattern

Three terms always associated with the command pattern are *client*, *invoker* and *receiver*. The *client* instantiates the command object and provides the information required to call the method at a later time. The *invoker* decides when the method should be called. The *receiver* is an instance of the class that contains the method's code.

**Client: Eater → Invoker: Waitress → Receiver: Chef**

The Chain of Responsibility forwards requests along a chain of classes, but the Command pattern forwards a request only to a specific module.

A command object encapsulates an action and its parameters.

1. Parameters
2. Actions

Example:

```
javax.servlet.http.HttpServlet  
protected void doGet(HttpServletRequest req, HttpServletResponse resp)
```
