

Spring Framework Design Patterns

There are loads of different design patterns used, but there are a few obvious ones:

- **Proxy** - used heavily in [AOP](#), and [remoting](#).
- **Singleton** (*default) - spring configuration files are singletons by default.
- **Prototype**
- **Template** method - used extensively to deal with boilerplate repeated code (such as closing connections cleanly, etc..). For example [JdbcTemplate](#), [JmsTemplate](#), [JpaTemplate](#).
